Track: Data Analytics
Organization: AnalystLab Africa

1. Planned & Completed Objectives

The goal for Week 6 was to move beyond high-level KPIs and investigate complex behavioral patterns driving patient no-shows. I successfully designed and developed an "Advanced Insights" Power BI dashboard page featuring multivariate bar charts and outcome-based logistical averaging tables.

2. Cross-Track Integration Activity

Track Collaborated With: Data Science.

Information Provided: A documented handoff memo detailing the highest-weight predictive features (booking_lead_days, reminder_channel) based on the validated EDA.

Project Improvement: This integration ensures the Data Science classification model is grounded in actual patient behavior patterns, directly improving the accuracy of future predictive deployments.

3. Key Findings & Decisions

Disproved the hypothesis that clinic distance and wait times are causing missed appointments; data shows attending and missing patients experience nearly identical logistical baselines.

Decided to focus strategic recommendations entirely on communication channels (SMS/WhatsApp) and advanced-booking interventions.

4. Proposed Focus for Week 7

Transition into end-to-end validation by designing a framework to test the impact of targeted, demographic-specific appointment reminders.
